ABSTRACT

Objective: To quantify data sharing trends and data sharing policy compliance at the *British Medical Journal (BMJ)* by analysing the rate of data sharing practices, and investigate attitudes and examine barriers towards data sharing.

Design: Observational study.

Setting: The *BMJ* research archive.

Participants: 160 randomly sampled *BMJ* research articles from 2009 to 2015, excluding meta-analysis and systematic reviews.

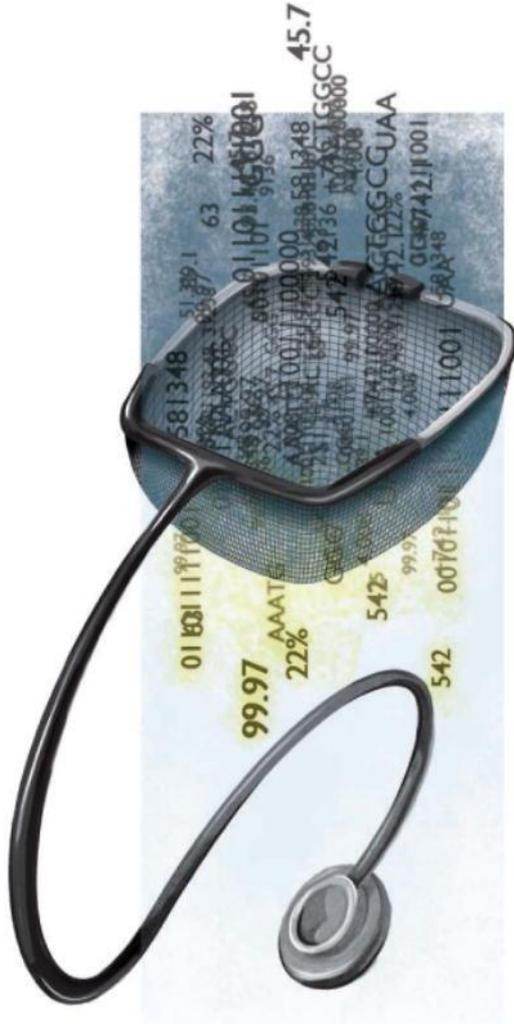

Main outcome measures: Percentages of research articles that indicated the availability of their raw data sets in their data sharing statements, and those that easily made their data sets available on request.

Results: 3 articles contained the data in the article. 50 out of 157 (32%) remaining articles indicated the availability of their data sets. 12 used publicly available

Strengths and limitations of this study

- Our study quantified data sharing among all types of research articles published in the *British Medical Journal (BMJ)* from 2009 to 2015.
- The *BMJ* data sharing policy specifically applies to clinical trial data, but our study analysed data sharing among all studies that have original raw data.
- The sample size was 160 articles, which is relatively small.
- The *BMJ* data sharing policy suggests using the *BMJ* as a broker to negotiate data access; however, we did not use this service given the amount of time and resources it required both on our part and on the *BMJ*'s.

Openness in scientific research

Data is the foundation of health and medical research

At the heart of open science is the principle that ***science belongs to humanity, to all of us***

Advance health and medical research and promote scientific innovation

Has open data arrived at the British Medical Journal (BMJ)? – an observational study

Aim of study: to quantify data sharing at the BMJ

Participants: 160 randomly sampled papers from 2009 - 2015 (no meta-analyses and systematic reviews)

Method: Analysed data sharing statements: is data available? Accessible? Verifiable? Policy compliance?

March
2009

- Concept of data sharing statement introduced

2010

- Concept of data sharing statement crystallised as policy

2012

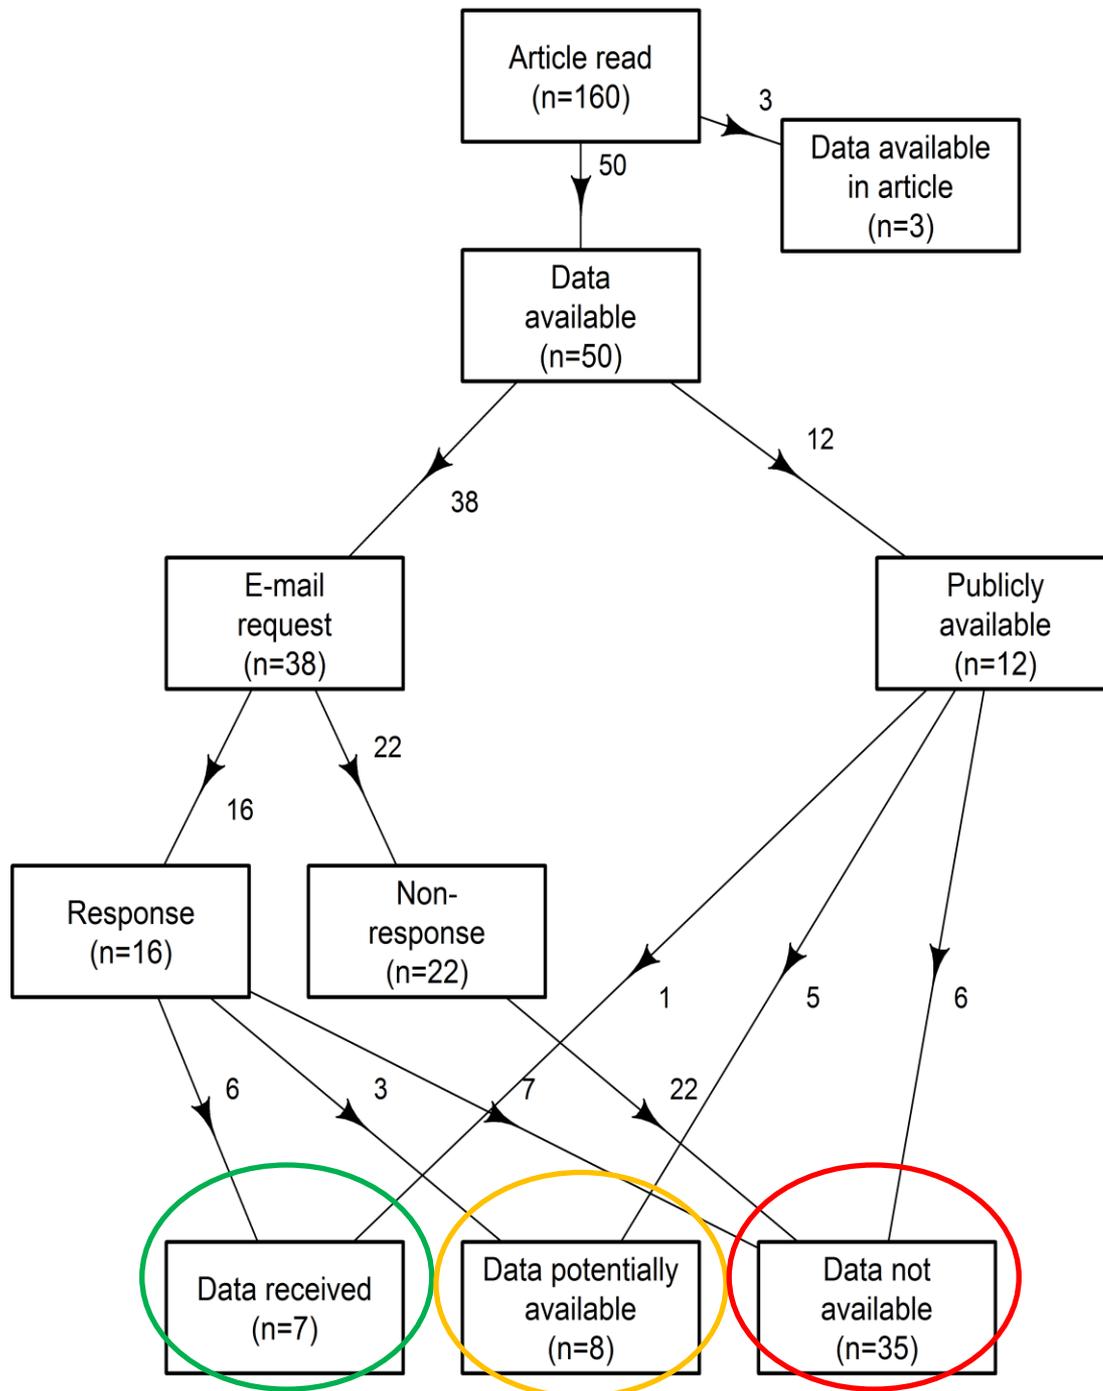

- Researchers informed of upcoming policy change in 2013

1 January
2013

- Trials of drugs and medical devices must commit to making anonymised patient level data available upon reasonable request

1 July
2015

- Policy ended to all submitted clinical trials not just those that test drugs and devices

Data sharing rate
for policy bound
articles
= **24%**
(95% CI: 8% to
47%)

Conclusions and recommendations

Possible explanations for low sharing rates:

- Wording of policy – too vague, loop holes are found
- Email requests for data end up in spam folders maybe?
- No rewards for data sharing

Time for tighter data sharing policy and better incentives for researchers to share their data

Thank you

@hmkyale

Sharing policy @bmj_latest not translating into a lot of sharing. Needs more than policies.
